Swimfresh Chlorine Tablets - 1 Tablets

Stabilised chlorine tablets are **slow dissolving** & contain the stabiliser **Cyanuric Acid**.

Cyanuric Acid, between 25 - 75mg/l in pool water, will reduce the destructive effect of sunlight (UV light) on free residual chlorine.

The level of Cyanuric Acid should not exceed 100mg/l. Above this level you may create a condition the industry calls "chlorine-lock", which will reduce the effectiveness & efficiency of free chlorine. Cyanuric Acid level can only be reduced by dilution of pool water with fresh water, & it is essential to monitor this level regularly. Cyanuric Acid Testing Kits are available in the Water Testing section of this catalogue.
