

Detox line

Skin reflects our inner state and as our body it can project our stress, our fatigue, the pollution excess or the harmful effects of cigarette smoke. The intoxicated skin must be protected against these assaults and reactivated to recover its freshness and tonicity. Besides protecting the skin against pollution, it is necessary to reinvigorate the cells by reactivating the cellular respiration and the production of ATP (cellular energy). It is important to supplement vitamins and trace elements which are essential for the cells metabolism, either by a direct intake or by reactivating the cutaneous microcirculation. Deeply re-oxygenated and detoxified, the skin recovers a radiant and glowing complexion.

Slimming line

At any age, women and men concerned with their body want to fight against unwanted curves, cellulite problems and ugly water retention that is swelling the skin tissues. Cellulite is the result of the swelling of the fatty tissues cells which are storing and releasing the fats : the adipocytes. These cells are able to stock fats up to 40 times their initial volume. Fatty tissues can be mainly found into the hypodermis but can be also found into the dermis. Collagen fibers trap the adipocytes swollen with fat and that leads to the appearance of cellulite giving the « orange peel » effect. The vascular system of this zone is then disturbed and the poor circulation can induce water leaks inside the dermis leading to an accumulation of fats into the water of the dermis and hypodermis layers. Thanks to an extremely precise combination of synergistic assets, it is possible to normalize the storage of fats for a reshaped silhouette.

Oily skin line

On the surface, an oily skin is shiny and look thicker, with a dull complexion and has imperfections and dilated pores. Deeper, an abnormal production of sebum by the sebaceous glands can be observed. It is called seborrhea. The sebaceous and hair ducts are blocked, it causes an inflammation, and then imperfections. To improve the quality of the oily skins, it is necessary to tighten pores in order to even the complexion, reduce seborrhea and purify the skin to avoid microbial spread. The complexion is radiant, the skin is no longer shiny, the imperfections vanish and disappear. The skin recovers its original softness.

Problematics

Collagen

Collagen is the main protein in the skin. It is responsible of the skin resistance and firmness. It comes in several forms depending on its various functions. Collagens called I, III and V ensure the architecture of the dermis. Collagens IV and VII link epidermis to dermis. Stimulating the production of these collagens is the first action to regenerate the skin.

Centella

Centella asiatica is an herbaceous plant species originally from Asia and Oceania. Its active principles, such as asiaticoside acid, allow to soothe the itching, reduce the redness, and heal more easily. It is famous for stimulating the production of collagen, repair damaged skin, delay cutaneous aging and prevent the appearance of stretch marks.

Hyaluronic acid

Like a true organic sponge, hyaluronic acid is able to hold up to 1000 times its weight in water into the dermis. Thus, it prevents skin dehydration. It contributes to form the connective tissue that contains the support fibers : collagen and elastin fibers. As a result, it plays a fundamental role in skin density and firmness. Applying hyaluronic acid on the skin surface helps to bring back progressively density and hydration. The skin recovers firmness and tone.

Premium

Stem cells

Stem cells are called undifferentiated cells : their functions are to auto-renew and supply, on demand, differentiated cells to repair, renew, restore the normal functioning of the tissues. It is essential today to ensure the in vitro viability of the cutaneous stem cells but also their auto-renewing capacity. It is possible to measure the impact of active elements such as plant stem cells to maintain the skin stem cells in good condition.

Retinol

Retinol, or vitamin A, is playing a major role in the differentiation of the epithelial tissues, growth and reproduction. It regulates the migration and transformation of keratinocytes to the cornified layer. Thus, it fastens the cellular renewal. By relaunching the cellular metabolism, vitamin A improves the quality of old skins.

Classics

Cleansers

Over time, skin is loaded with sebum and pollutants : to which have been added traces of make-up. Cleansers are designed to cleanse, clean up and tone, sometimes in a single step, the face and the eyes. The skin is clean and neat. It regains its natural breathing and freshness.

Exfoliators

Skin cells renew continuously in 21 days, by coming up from the deepest layer of the epidermis to the surface where they accumulate and stagnate. With air pollution and other external aggressions, the skin becomes thicker and doesn't let the light shine anymore. It turns dull. Exfoliation will remove this superficial layer of dead cells that stay on the surface of the skin. Thus, skin recovers its glow and luminosity and its texture is evened out.

LYON SKIN CARE

Creator of your cosmetic idea
Made in France

Lyon Skin Care is a company, located in Lyon, which draws its inspiration from the world of cosmetics, since more than 35 years. Always listening to its customers, the innovative company focuses its research and development on new products and strong concepts, original and unique textures, from raw material of any origin: biotechnology, synthetic or vegetable .

The know-how and expertise of its leaders allow the manufacturing of high quality products. High standard is the company's key word, both in the R & D laboratory and in the production units.

Our job is to create, formulate, develop and manufacture cosmetics for their customers. We are « tailor made » who produce only face and body care products for men and women. The research and development laboratory is assisting the customers all throughout the development of new concepts. It can also provide standard preparations registered in the catalog.

For almost 30 years the company exports most of its products to Asia where it is a pioneer. Lyon Skin Care leaders have been able to develop on this market an own client base and establish a long lasting presence.

Problematics

Soothing line

A sensitive and intolerant skin reacts more than a normal skin. It is hyper-reactive. A sensitive skin suffers from tingling and heating, when facing elements that normally do not trigger any irritation. This hyper-sensitivity of the skin comes from a reduction in the skin tolerance threshold. The weaker this tolerance level is, the more sensitive the skin becomes. The decrease of the skin tolerance threshold may be caused by an alteration of the cutaneous barrier function, by the skin dehydration, by an overproduction of free radicals or by a wrong answer from the cutaneous immune system. To improve the reactivity level, it is necessary to calm and soothe the skin by reducing the release of the neurotransmitters which are responsible of the inflammatory answer from the cutaneous tissue.

Depigmenting line

Under the influence of various factors, such as UV exposure, hormonal disturbance or age, some melanocytes (the cells that produce melanin) overproduce and release a huge quantity of melanin in the keratinocytes. Under the action of the cell renewal, these keratinocytes come up to the surface of the skin and stains appear. To treat the pigment spots, it is necessary to reduce the production of melanin by acting on many parameters of the melanocyte physiology. 4 active ingredients have been selected to help recovering a fair and luminous complexion and fight effectively against the pigment stains.

Moisturizing line

Dermis is the water tank of our body. It contains 80% of the water linked to the molecules able to store it, such as hyaluronic acid, collagen, or proteoglycans. The water stocked in the dermis is continuously moving to the surface and is successively soaking the different layers of the epidermis. The water is held on the surface of the skin by the Natural Moisturizing Factor and also by the intercellular cement bilayers of the stratum corneum. The complementarity of 5 active elements specially selected is creating a synergy which enables an optimal and immediate hydration by acting on the major zones able to trap water, creating this way a dynamic hydration of the 5 layers of the skin. These powerful moisturizers are plumping your skin, making it more radiant and quenched all throughout the day.

Problematics

Nourishing line

Dry skin suffers from pulling, discomfort and roughness. Skin dryness comes from various factors : the corneous layer is running out of water, the hydrolipid film located on the surface is too thin or damaged, the corneous layer is running out of protective lipids... The skin is stretched, then tight and cracked. Apart from the age, the dryness of the skin depends on several factors :
- A low humidity level, cold and dry weathers...
- Wind and sun exposure, stress, tobacco...
A nourishing cream will remedy the lack of lipids from the skin and help the hydrolipid film to be reformed. Skin is nourished and regains its comfort thanks to omega 3 and 6, which strengthen the intercellular cement and maintain the elasticity and softness of the skin while protecting it from dehydration. Vitamins B6 and B5, play an important role in sulfur amino acids metabolism, which are responsible of the epidermis construction. The combination of these 2 elements contributes to strengthen the intake of omega3.

Anti-aging line

From the age of 30, the cutaneous regeneration is slowing down and the first skin aging signs appear. Little by little, the skin becomes dehydrated, slackened and dull. First of all, the skin is the outer organ of the body. It suffers daily from free radical attacks from the sun radiation, pollution and tobacco... Defence systems are overwhelmed and skin structures are affected and weakened. Then, the renewal of the major components of the skin is slowing down, the first wrinkles appear, their quantity and depth will double every 10 years. Over time, the collagen and elastin fibers network is slackening, so as the skin. The facial contours are less clearly defined, especially around the jaw and in the neck area. For each step of aging, some targeted actives can be used to stimulate the firmness and the density of the skin, bringing back energy, remodeling and refining the volumes for a youthful appearance.

Glow line

Skin's radiance depends on several parameters as follows :
The melanin rate : if the level of oxidized melanin (melanin that colors when oxidizing and forms little brown stains) is too high, the complexion is not even any more and it loses its natural glow.
The skin's relief : the smoother the skin is, the more it will act as a mirror, reflecting evenly the light. The complexion turns more radiant.
The skin's moisture level : the more the skin is hydrated, the more the complexion is even.
The skin texture : to improve the skin grain, it is necessary to reduce the size of the pores and fight against cutaneous imperfections.
The Baby skin cream corrects simultaneously : pores, stains, redness and dull complexion. It makes a beautiful and natural skin. The skin is perfectly hydrated and the complexion seems even, clear and radiantly fresh.
