## ■ 1. CONSTRUCTION OF ALUMINIUM ELECTROLYTIC CAPACITORS

High gain etched anode foil with the thick oxide layer, which is produced by the forming-process, is shown at the top of figure 2. The cathode foil with a much thinner oxide layer is arranged at the bottom. Layers of papers are separating both foils. The electrolyte fills up the pores of the aluminium foils and contacts the anode and cathode surface to establish the capacitance. The dielectric consists of the oxide layers of the anode foil respectively the cathode foil. This construction builds two capacitances: the anode and the cathode capacitances. Because of the thicker oxide layer the anode capacitance is normally much smaller than the cathode capacitance.

# Aluminium Electrolytic Capacitors

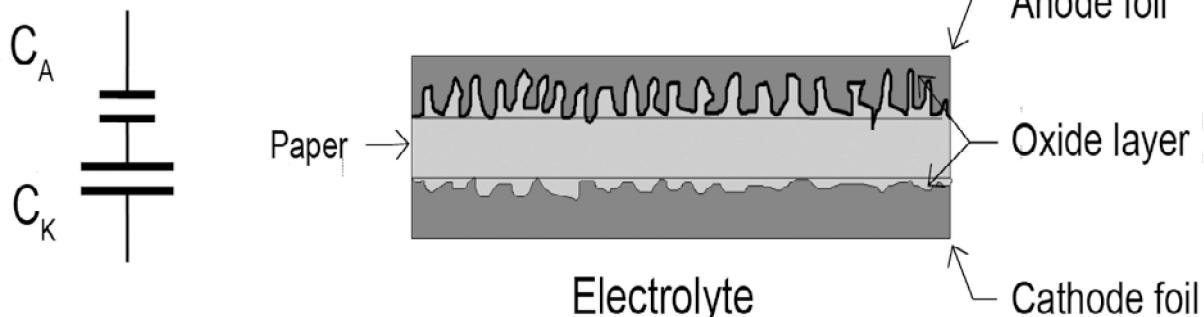

Fig2 shows a cross section of the winding.

If two capacitors are connected in series, the total capacitance results from the relationship

$$CG = CA * CK / (CA + CK)$$

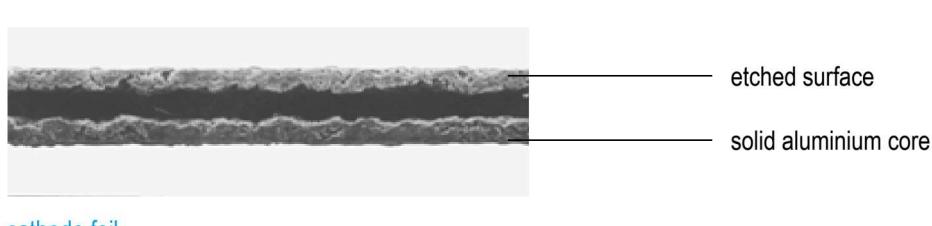

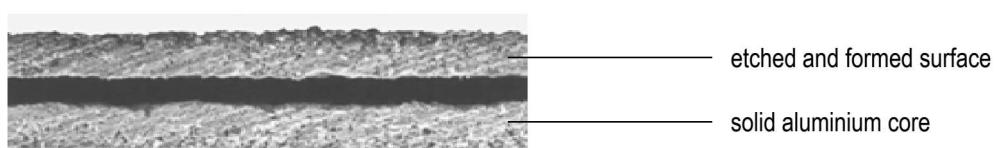

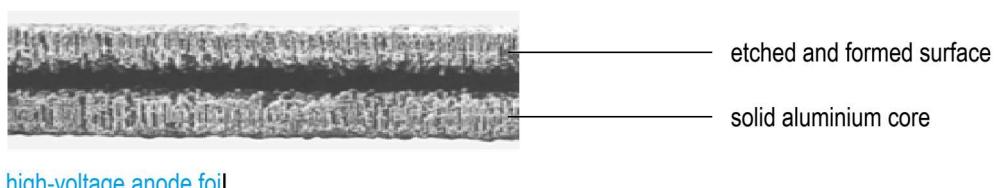

If  $CA \ll CK$  it follows  $CG \approx CA$ . (aspired normal case)

This means the anode capacitance determines the capacitance of the whole capacitor (the cathode foil slightly decreases the capacitance). To accomplish that, highly etched cathode foils are necessary.

Nonpolarized electrolytic capacitors use the same foil for anode and cathode ( $CA = CK$ ) Therefore the capacitance of these capacitors are given by  $CG = 0,5 * CA$ .

It is obvious that a nonpolarized electrolytic capacitor needs two times the space of a polarized capacitor.

## ■ 2. DIFFERENT TYPES OF FOIL

# Aluminium Electrolytic Capacitors

## ■ 3. PARAMETER

### ■ 3.1. RATED VOLTAGE

The rated voltage (UR) is the voltage the capacitor is designed for. This voltage may be applied continuously to the capacitor over the full temperature range.

### ■ 3.2. RIPPLE VOLTAGE

In many applications the voltage applied to capacitors is a combination of direct and alternating voltage. Pay attention to the following points:

- The superposition of AC and DC must not exceed the rated voltage
- Reverse voltage is not allowed
- The applied ripple current must not exceed the rated ripple current

### ■ 1.4. MAXIMUM REVERSE VOLTAGE

The Aluminium Electrolytic Capacitor is a polar component. Diodes with a max. conducting state voltage of 0.8 V could be used to prevent reverse polarity voltage. Single short time reverse polarity of  $V < 1.5$  V for  $t < 1$  s is tolerated.

### ■ 1.5. RATED CAPACITANCE

The rated capacitance is usually determined at 100 Hz and 20 °C. In general the rated capacitance is marked on the capacitor in  $\mu\text{F}$ .

### ■ 1.6. DC AND AC CAPACITANCE

The capacitance determined by AC measurements is smaller than the capacitance determined by charge / discharge measurements. In most applications the capacitor is applied to an alternating voltage so in general the capacitance is measured with the AC method.

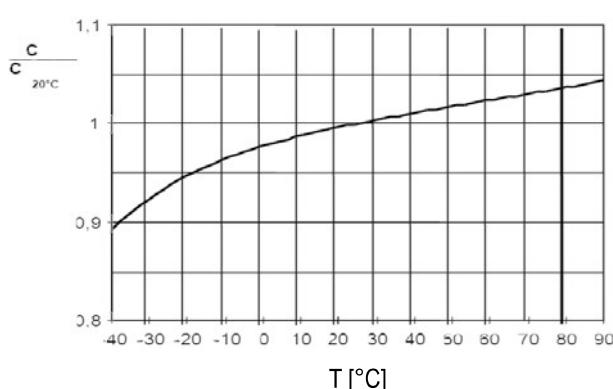

### ■ 1.7. CAPACITANCE VS TEMPERATURE AND FREQUENCY

The capacitance varies with temperature and frequency

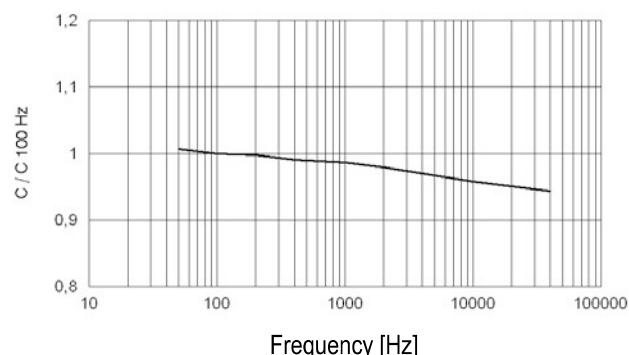

- The capacitance increases with increasing temperature
- The capacitance decreases with increasing frequency

The following diagrams illustrate these interdependent relationships.

Capacitance as a function of ambient temperature T

Capacitance C/C 100 Hz -typical- as a function of ambient frequency f

## ■ 3.8. ESR

The equivalent series resistance represents the losses of a capacitor (the resistance of the foil, electrolyte, terminals). The ESR depends on frequency and temperature.

## ■ 3.9. ESL

The equivalent series inductance represents the inductive part of the capacitor (leads, foil). The ESL depends mainly on the frequency.

Equivalent circuit of an electrolytic capacitor (simplified)

## ■ 3.10. DISSIPATION FACTOR TAN Δ (DF)

The dissipation factor is defined as the power loss of the capacitor divided by the reactive power of the capacitor.

$$\tan \delta = \text{ESR} * \omega * C_S$$

In general the DF is measured at 100 Hz and 20 °C.

## ■ 3.11. IMPEDANCE Z

The impedance of the capacitor is given by the ESR, ESL and the capacitance.

The impedance depends on the temperature and the frequency. The impedance is normally measured at 10 kHz.

## ■ 4. MOUNTING

Position for screw terminal capacitors

Upright position is recommended to prevent electrolyte leakage in case of vent opening.

Horizontal mounting is also possible but the vent must faces upwards.

## ■ TERMINALS / MOUNTING STUD

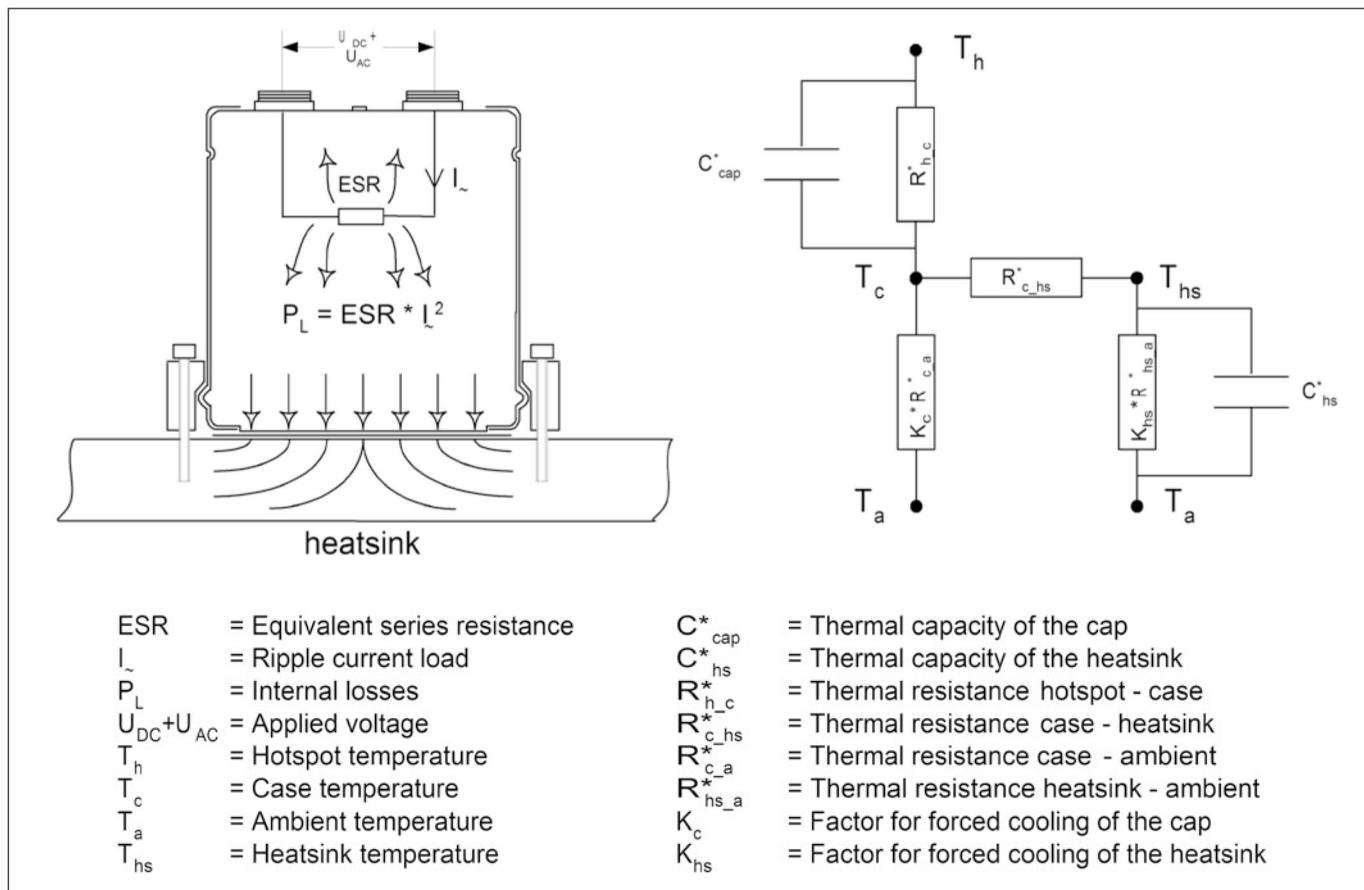

These maximum torque values should not be exceed.

## ■ 6. QUALITY

### ■ 6.1. CERTIFICATION

Quality is the main reason of our success. Without ignoring the importance of price of course, customers choose and remain with Fischer & Tausche Capacitors to satisfy their needs for top quality capacitors. It is therefore our pledge to continue producing and delivering top quality capacitors as efficiently as possible.

In addition to our commitment to quality, we are also committed to a healthy environment. That is why each and every one of our employees, from top management down to the workshop, accepts his or her environmental responsibilities and strives to work as effectively and efficiently as possible.

Intermediate testing is carried out through the entire production process in addition to the 100% final testing of each capacitor before shipment. All of our employees know that quality is the top priority for our customers. Workers participate in the process of continued improvement, quite often by anticipating. The result is uninterrupted flow production. Fischer & Tausche Capacitors are certified 9001:2008. The company certificate is available on the Fischer & Tausche Capacitors website [www.ftcap.de](http://www.ftcap.de).

## ■ 7. SAFETY

### ■ 7.1. CHARGED CAPACITORS

Electrolytic capacitors may store high amounts of energy (especially photo flash and high voltage capacitors).

To avoid electrical shocks and sparks always discharge electrolytic capacitors before handling.

For higher voltage it is recommended to shorten the terminals during handling.

### ■ 7.2. DANGER OF USE AND ABUSE

Explosions of electrolytic capacitors may occur if the capacitor is exposed to

- reverse voltage above specified limit
- voltage above specified limit
- ripple currents above specified limit
- ambient temperatures above specified limit
- high mechanical impact

### ■ 7.3. OPERATING ELECTROLYTES

Principally operating electrolytes used in Fischer & Tausche Capacitors products do not contain dangerous substances. However, in rare exceptional cases it is necessary to use certain substances to achieve certain physical chemical or electrical properties. In these cases the concentration is reduced to an absolute minimum.

Generally the following safety hints should be respected using operating electrolytes:

Avoid skin and eye contact. Should the electrolyte come into contact with skin, immediately rinse with abundant amounts of fresh water. Eyes must be rinsed at least 15 min under flowing cold water. Consult your doctor immediately with complaints. Inhalation of electrolyte蒸气 or vapors must be avoided. Work area must be well ventilated. Clothes coming into contact with electrolyte should be washed and cleaned.

### ■ 7.4. ROHS

All Fischer & Tausche Capacitors products are fully compliant with the RoHS Directive 2005/618/EC.

### ■ 7.5. DISPOSAL

Aluminium Electrolytic Capacitors can be disposed or recycled. The disposal rules are governed by the national and local authorities and have to be taken into consideration. The European Waste Code No. is 160214
